

EXPIRING INTENT LEASE (L_intent) TIMELINE & SCENE DRIFT ESCALATION

Asynchronous System 2 deliberation (800 ms) vs. continuous real-time environment mutation

INTENT LEASE ZERO-ALLOCATION C STRUCT (SHARED SRAM)

```
struct __attribute__((packed)) IntentLease {
    uint64_t lease_id; // Monotonic sequence
    float target_se3[12]; // 3x4 metric affine matrix
    uint64_t valid_from_ns; // Hardware exposure epoch
    uint64_t valid_until_ns; // Strict TTL expiration
    float max_drift_meters; // Spatial drift gate (0.015m)
    uint32_t crc32_checksum; // Payload integrity
};
```

LEASE SAFETY ESCALATION STATE MACHINE

- **Zero Dynamic Allocation:** Static memory footprint evaluated in FreeRTOS ISR.
- **Automatic Re-trigger:** System 2 requested to re-snap camera and re-deliberate.
