

Open-Loop Error Masking vs. Closed-Loop Compounding State Divergence

(a) Open-Loop Evaluation (Dataset Replay): Errors are Memoryless and Discarded at Every Clock Step

(b) Closed-Loop Execution (Physical Rollout): Small Systematic Bias Compounds into Catastrophic Collision

STRUCTURAL COMPARISON: OPEN-LOOP REPLAY VS. CLOSED-LOOP EMBODIED EXECUTION

1. Input State Source

Open Loop: Stored disk logs ($s_t^+ \sim \mathcal{D}_{\text{demo}}$)
Closed Loop: Endogenous state ($s_{t+1} = f(s_t, a_t)$)

2. Error Propagation

Open Loop: Memoryless, zeroed at every step
Closed Loop: Compounding: $y(t) = \int v \sin(\theta) dt$

3. State Support

Open Loop: Evaluates only on expert trajectories
Closed Loop: Perturbation pushes policy to unvisited states

4. Evaluated Outcome

Open Loop: 99.7% Directional Agreement
Closed Loop: 0% Task Success (Wall Collision)
